DESIGN PRINCIPLE

设计原则

- 1、物品由污到洁单向流程，不交叉、不逆流；
 - 2、去污区、检查包装及灭菌区和无菌物品存放区之间设计实际屏障；
 - 3、去污区与检查包装及灭菌区之间应设洁、污物品传递通道，并分别设人员出入缓冲间；
 - 4、缓冲间感应式洗手设施；
 - 5、检查包装及灭菌区设专用的封闭式洁具间。
-
1. The whole process from a contaminated area to a clean area, without any cross or reverse.
 2. Physical barriers are placed between the decontamination area, package inspection and sterilization area, and sterile area.
 3. Delivery paths are established between decontamination area and package inspection & sterilization area, the buffer rooms should be placed separately for people enter and entrance.
 4. The hand washing facility in the buffer room should be inductive.
 5. A Sealing-type sanitary ware room should be included in the package inspection & sterilization area.

第一屏障：对抗病原微生物第一屏障，位于污染区和清洁区。高通量清洗消毒器对污染物品进行清洗、消毒，双门通道式设计最低化降低交叉感染。

第二屏障：对抗病原微生物第二屏障，位于清洁区和无菌物品存储区。
大型双门通道式灭菌器对清洗消毒后的物品进行灭菌，有效保证灭菌物品的安全。

The First Shield: The first shield is located at contamination area and clean area to prevent the pathogenic microorganism. High-throughput cleaning and sterilizing functioned by the washing disinfecter and the double-door design of which is efficiently reduce the cross contamination.

The Second Shield: The second shield is located at clean area and sterile item storage area to prevent the pathogenic microorganism.
The big double-door sterilizer functions to sterilize the cleaned and disinfected item, which ensure the safety of the sterilized items.

✓ 卧式脉动真空蒸汽灭菌器

Horizontal pulse vacuum steam sterilizer

本灭菌器采用压力饱和蒸汽对物品进行灭菌操作，以脉动真空排气方式消除冷空气对温度的影响，最终真空抽湿结合套层烘干使物品干燥。是利用压力饱和蒸汽在冷凝时能释放大量潜热的物理特性，使待灭菌的物品处于高温和潮湿的状态，经过一定的时间，使物品中所有细菌及芽孢组织遭到破坏，从而达到灭菌的目的。主要用于医院、化工、食品、科研、制药等单位，对手术器械、敷料、药品、培养基、食品等作消毒灭菌使用。

The sterilizer works on pressurized saturated steam for sterilization of items, eliminating the impact of cold air on the temperature by means of pulsating vacuum exhaust, and eventually drying the items by vacuum dehumidification realized in a jacket. It utilizes the physical property that pressurized saturated steam can release a large amount of latent heat when condensing, rendering the items to be sterilized under high temperature and humidity. The purpose of sterilization is attained after a period during which the bio-structure of all the germs in the items are completely destroyed. It is mainly used in hospitals, chemical industry, food, scientific research, pharmaceutical and other units for disinfection and sterilization of surgical instruments, dressings, medicines, culture medium, food, etc.
